Imagine a tiny creature, dressed in a fiery red armor, no bigger than a grain of rice, meet the fire ant! These fascinating little critters have a reddish-brown color, almost like a tiny spark of fire. They are known for their distinctive mound-shaped nests, which they build using soil. And they've got a sting that's as fiery as their color, which is how they got their name.

Now that we've seen their fiery exterior, let's peek into their homes. Fire ants live all over the world, but mostly in warm climates like the southern parts of the United States. They build large colonies in soil, with mounds that can be up to 18 inches high. Inside these mounds, they make a network of tunnels and chambers where they live and raise their young.

From their fiery houses, these little warriors venture out in search of food. They are omnivores, meaning they eat both plants and other small creatures. Their diet includes seeds, fruits, insects, and even small animals. In fact, they are known to attack in groups to take down larger prey.

Fire ants are not just interesting, they're also important players in the ecosystem. They help control pests by eating other insects and small animals. However, they can also be a nuisance to humans, as their stings are painful and can cause allergic reactions. So next time you see a mound in the ground, remember the fiery little warriors beneath, and keep a respectful distance.

Fire Ants

Solve each problem.
