Let's dive into the world of beavers, the hardworking engineers of the animal kingdom! Beavers, with their chubby bodies and flat, paddle-shaped tails, are a sight to behold. They have shiny brown fur that keeps them warm in cold water and sharp, strong teeth that can chomp through tree trunks! And did you know that their teeth never stop growing? That's why they have to keep gnawing on wood.

Speaking of gnawing on wood, let's nibble on what beavers love to eat. Their menu consists of tree bark, twigs, leaves and aquatic plants. In the winter, they munch on stored food they've stashed away in their lodge. Just like us having a pantry full of snacks!

Now that we know what they eat, let's explore where these

fascinating creatures live. Beavers are found in North America, Europe, and Asia, making cozy homes called lodges in rivers and ponds. They build dams out of sticks and mud to create ponds, providing them with protection from predators. These dams can be so big that they change the landscape around them!

Just like us humans, beavers have a huge impact on their environment and other animals. Their dam-building activities create wetlands which are beneficial for other wildlife and help control flooding. However, they can also be a nuisance when they gnaw on trees and crops or block streams with their dams. But remember, each beaver is just doing its best to survive in the wild, just like every other creature on Earth.
