Imagine a moth as big as your hand, with wings that look like an elephant's skin! That's the elephant hawk moth, a dazzling insect with large, olive-brown wings that resemble the rough texture of an elephant's hide. This moth also has bright pink stripes that make it one of the most colorful creatures you'll ever see in your garden! And guess what, it's not just big and beautiful; it's also a master of disguise, able to blend in perfectly with leaves and twigs.

Speaking of gardens, these flying wonders are usually found in places with lots of plants. Elephant hawk moths love to live in

meadows, gardens, and woodland areas, especially in the United Kingdom. But these aren't the only places you can find them; they also pop up in parts of Asia and all across Europe. Wherever they are, they're busy sipping nectar from flowers with their long tongues, much like a hummingbird!

Remember the nectar that these moths love so much? Well, it's not their only food; their caterpillars are big fans of willowherbs and bedstraws. These munching machines transform into pupae during the winter, and when spring arrives, they emerge as the spectacular elephant hawk moths we know and love. And while they're mostly harmless to humans, they can give a nasty surprise to any unsuspecting predator with a sudden flash of their bright colors.

You might be wondering how these moths are different from others, right? Well, apart from their unique looks and large size, elephant hawk moths are also unusual because they're nocturnal, which means they are most active at night. They also have an exceptional ability to see colors even in the dark, something most other moths can't do. So, from their elephant-like textures to their hummingbird-like dining habits, it's clear that the elephant hawk moth is one truly remarkable creature!

Solve each problem.

1) What is the color of the stripes on the elephant hawk moth? A. Red B. Blue C. Pink D. Yellow 2) What color are the elephant hawk moth's wings? A. Light blue B. Dark pink C. Olive-brown D. Imagine a moth as big as your hand, with wings that look like an elephant's skin! That's the elephant hawk moth, a dazzling insect with large, olive-brown wings that resemble the rough texture of an elephant's hide. This moth also has bright pink stripes that make it one of the most colorful creatures you'll ever see in your garden! And guess what, it's not just big and beautiful; it's also a master of disguise, able to blend in perfectly with leaves and twigs.

Speaking of gardens, these flying wonders are usually found in places with lots of plants. Elephant hawk moths love to live in

meadows, gardens, and woodland areas, especially in the United Kingdom. But these aren't the only places you can find them; they also pop up in parts of Asia and all across Europe. Wherever they are, they're busy sipping nectar from flowers with their long tongues, much like a hummingbird!

Remember the nectar that these moths love so much? Well, it's not their only food; their caterpillars are big fans of willowherbs and bedstraws. These munching machines transform into pupae during the winter, and when spring arrives, they emerge as the spectacular elephant hawk moths we know and love. And while they're mostly harmless to humans, they can give a nasty surprise to any unsuspecting predator with a sudden flash of their bright colors.

You might be wondering how these moths are different from others, right? Well, apart from their unique looks and large size, elephant hawk moths are also unusual because they're nocturnal, which means they are most active at night. They also have an exceptional ability to see colors even in the dark, something most other moths can't do. So, from their elephant-like textures to their hummingbird-like dining habits, it's clear that the elephant hawk moth is one truly remarkable creature!

Solve each problem.
